AMILab Scripting: You can view 2D and 3D images and surfaces and also apply filter to them. You can view images and surfaces on one screen. AMILab Features: image view in 2D surface view in 3D 3D rotation Image tool Image composition AMILab is an application designed for image processing. AMILab has many features, including image composition, such as combining two images into one image, image analysis, such as transforming and resizing a image, and image registration, such as aligning two images. Introduction AMILab is a handy application designed for image processing that includes its own scripting language. AMILab also features an interface to help you view 2D / 3D images and 3D surfaces. AMILab has a lot a features, and has been especially used for academic research in medical image processing. AMILab Description: With AMILab, you can view 2D and 3D images and surfaces. You can apply filter to 2D and 3D images and surfaces. AMILab Scripting: You can view 2D and 3D images and surfaces and also apply filter to them. You can view images and surfaces on one screen. AMILab Features: image view in 2D surface view in 3D 3D rotation Image tool Image composition Hierarchy of application needs Features Jobs need to be done on a disk image and not a file system, so it must be mounted as a disk image. We would like to view the data inside a disk image. Requirements Disk image needs to be auto mounted to show all the disks Volume information to be in the view. The command line tools are acceptable. Notes A: A combination of the two would be to view the data in a file system with DD. I haven't used it myself, but I know of several others who have done so. I would use the disk image with an archive utility (Xar, etc.) to decompress it, as this would provide you the most flexibility in what you can do with the image. What's New in the AMILab?

AMILab is an Image Acquisition and Image Processing software that provides a graphical user interface. It consists of a set of C++ applications, the Image Acquisition component, which in turn includes several modules for real-time image acquisition and processing. The Image Processing component includes modules for image segmentation, color quantification, 2D and 3D surface rendering, and a scripting language for image processing. The Image Acquisition component provides the ability to set up a user-defined sampling scheme that automatically integrates and discards frames, to automatically capture 2D images and to process real-time sequences of images, to support colorimetry and to retrieve the textural properties of the images. In the Image Processing component, image segmentation can be used to define regions of interest, color quantification can be used to define colors in images, 2D and 3D surface rendering can be used to render objects from images, and a scripting language for image processing can be used to apply sophisticated post-acquisition image processing algorithms, e.g. for tissue typing or for feature extraction. The AMILab application consists of an Image Acquisition module, the Image Processing module, and a Scripting module. The Image Processing module is composed of the DICOM (Digital Imaging and Communications in Medicine) data acquisition module, the image segmentation module, the color quantification module, the 2D and 3D surface rendering module, and the image classification module. The Scripting module provides an interface to an interpreter for AMILab. The interface consists of the AMILab GUI (Graphical User Interface) and the AMILab Scripting interface. Users and Features: This is a command line based application for Image Processing and Image Acquisition and 3D visualizations. It is designed for use with a PC. It is used primarily for computational tasks such as 2D or 3D image segmentation, color quantification, and 3D visualization. In addition, the AMILab scripting language is often used to interact with the AMILab software. One advantage of AMILab is that it is free software. It is free to use, free to distribute, free to modify, and free to distribute modified versions. Features: Color quantification and segmentation of multiple 2D images. Image visualization of 3D data Image classification. User-defined sampling scheme. Real-time image acquisition. Color-control colorimetry. Post-acquisition image processing. User-defined data sampling. User-defined parameter sampling. User-defined image viewing and animation. Outputs numerical data for use in statistical analysis. User-defined layout and printing. Limitations: This is a command line based application for Image Processing and Image Acquisition. Utilities: AMILab Command Line Tool AM
