I took on the opportunity to interview Dave Sarachan, Lead Gameplay Designer of FIFA. He's a key part of creating and polishing FIFA gameplay. We discussed the HyperMotion Tech, FIFA 20's development and gameplay features, and of course discussed EA's acquisition of the franchise. Paulius: I'd like to ask what type of football matches your team takes part in and what kind of movements are captured in them? Dave Sarachan: Most of the data is harvested from a set of FIFA games played in 2K Arena. The data is then used to simulate in-game actions such as footballs, shots, and shots on goal; all things that would be tracked in a real match. The data is pulled from every player that appeared in the match and the data is then processed to create a player model which is used in the game. There's a bunch of other data that's captured as well. You have data from matches in Pro Clubs mode and FIFA Ultimate Team which we use for on-pitch animations. These are things you couldn't do in an actual match. The data includes information about performance in the match such as the time on pitch, the amount of touches, distance covered and so on.

These little bits of information allow us to make realistic animations that match player intensity and movement. "FIFA 20 re-invented what needed to be improved for the FIFA series going forward." This allows us to use the data captured from the real players and adjust them for different match conditions, such as the pace of the game, the pitch conditions and so on. This is done via the Phantom World Simulation. The Phantom World Simulation allows us to switch between real-life and virtual matches and then analyse the data to understand the virtual player model. It gives you the flexibility to make any changes you feel are needed to make it more accurate. Paulius: What type of evaluation is done and how much of it is done by the players themselves? Dave Sarachan: We have individual players come into the lab to perform a full match. They are watched and their data is then used to build and perfect the physics engine, the physics engine a minor part of the game play mechanics, but a large part of how realistic the physics are. We then use these simulations to test the game. For example, we'll play a match with the
